

Final Project Exploration Approval

Acknowledgment Statement for Final Project Exploration Approval

I, William Maddock, acknowledge and accept the objectives and user stories outlined in this document for my final project exploration. I am committed to exploring the implementation of role-based access control and security clearance features, as well as addressing any challenges that arise in developing this solution to enhance the functionality and user experience for Shipping Agents and other stakeholders.

Description of What You Want to Explore and Learn

I want to explore and implement a security clearance feature that ensures users with specific roles, such as Shipping Agents, have the necessary permissions to access restricted areas like elevators and stairwells. My goal is to learn more about implementing role-based access control within a Rails application and to manage complex permissions dynamically based on user roles and current location requirements.

This feature should also include real-time feedback to inform users if they lack the required access permissions before they attempt entry, ensuring smooth and efficient workflows for all users.

User Story for Implementation

User Story: Prevent Security Clearance Issues for Access to Restricted Areas

As a Shipping Agent

I want to avoid being stuck in elevators or stairwells due to security clearance issues

So that I can efficiently complete my deliveries without delays.

Acceptance Criteria:

1. Shipping agents have the necessary clearance for elevator and stairwell access.
2. The system checks clearance for the building and delivery floors before access is granted.
3. Shipping agents are notified of any clearance issues before attempting access (Logistic Manager “approved or denied” the shipping agents elevated request).

Resources you found that will help you learn and implement

Here are some resources to help you implement dark mode in web applications, including approaches for Rails applications:

1. MDN Web Docs: Prefers Color Scheme Media Query

[MDN on prefers-color-scheme](#) - Learn about the CSS media query prefers-color-scheme to automatically detect users' color scheme preferences (light or dark mode). This guide is a great introduction to how to set up dark mode purely with CSS.

2. CSS Tricks: Dark Mode in CSS

[CSS Tricks Guide on Dark Mode](#) - This guide offers a comprehensive look at implementing dark mode in web applications, covering CSS, JavaScript toggles, and the prefers-color-scheme media query.

3. Rails Guides: JavaScript and CSS for Dynamic Mode Switching

[Rails Asset Pipeline Guide](#) - For Rails applications, you can dynamically serve CSS for light and dark mode by managing CSS files with the Rails Asset Pipeline. Consider separate CSS files for each theme and use JavaScript to toggle them.

[Stimulus Reflex Dark Mode Tutorial](#) - If you're using Stimulus JS with Rails, this tutorial demonstrates how to add a dark mode toggle to a Rails app using Stimulus.

4. Using Tailwind CSS for Dark Mode

[Tailwind Dark Mode Guide](#) - Tailwind CSS offers a built-in dark mode feature that uses the prefers-color-scheme media query. This can be useful if you're using Tailwind for styling in Rails and want a straightforward way to implement dark mode.

5. JavaScript Toggle with Local Storage

[Toggling Dark Mode with Local Storage \(CSS-Tricks\)](#) - This tutorial provides a method for creating a dark mode toggle using JavaScript and storing the user's preference with Local Storage so that it persists across sessions.

6. Dark Mode Icon Library for Visual Cues

[Heroicons](#) - Heroicons offers a collection of icons, including light and dark mode icons, that you can use to indicate dark mode toggling. This is especially useful in Rails for adding visual cues for the toggle.

7. Frameworks and Libraries Supporting Dark Mode

[Bootstrap Dark Mode](#) - Bootstrap 5 includes dark mode utilities that make it easier to add dark mode to your Rails app if you are using Bootstrap as your CSS framework.

[Material UI Dark Mode](#) - Material UI provides dark mode support if you are using it with React. You can still adapt the Material Design color principles for Rails applications.

8. Dark Mode Design Principles

[Dark Mode Design Best Practices by Apple](#) - Apple's Human Interface Guidelines provide useful design principles to consider when implementing dark mode, such as maintaining contrast and adjusting colors for readability.

9. Articles and Best Practices

[Building Dark Mode: Tips from Smashing Magazine](#) - This article offers tips on building dark mode in web apps, including common pitfalls, color adjustments, and best practices.

[Google Material Design Dark Mode](#) - Google's Material Design guidelines for dark theme provide recommendations on colors, elevation, and contrast that ensure accessibility and readability.

Here are some helpful resources for working with databases in Rails 7:
